**Authors:** Nicolas, Gaël | Beherec, Laurène | Hannequin, Didier | Opolczynski, Gaëlle | Rothärmel, Maud | Wallon, David | Véra, Pierre | Martinaud, Olivier | Guillin, Olivier | Campion, Dominique

**Abstract:** Background: Although numerous studies have assessed cognitive dysfunction in patients with schizophrenia, very few have focused on the diagnosis of dementia. Methods: 96 patients with schizophrenia (48 inpatients and 48 outpatients), aged 50 to 70 years, underwent a psychiatric, neurological and neuropsychological evaluation at baseline and after a 20-month follow-up. We established a diagnostic procedure for dementia according to the DSM-IV criteria, using the Mattis Dementia Rating Scale; 1) identify dementia using the Mattis Dementia Rating Scale; 2) characterize dementia using brain imaging, perfusion brain SPECT and laboratory tests including Alzheimer's disease cerebrospinal fluid biomarkers and genetic determinants. Results: Fourteen patients fulfilled the diagnostic criteria for dementia. They were diagnosed with possible or probable behavioral-variant frontotemporal dementia, with probable Alzheimer's disease, two with probable vascular dementia (including one due to CADASIL), one with CNS inflammatory disease, and six could not be fully characterized. Conclusions: The diagnosis of dementia in middle-aged patients with schizophrenia is challenging but possible, using a multistep procedure. The most frequent condition, bvFTD, could reflect the presence of an evolutive neurodegenerative process in some patients.
